                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an isolated polypeptide (I) comprising a variant CC form of a mouse HYPLIPI polypeptide sequence (S1) or a human FCHLI CC polypeptide sequence (S2), not given in the specification, where the CC variant form is associated with cancer, or an amino acid sequence having CC at least 65 % sequence identify to (S1) or (S2). A composition comprising CC DNA encoding (I) is useful for treating or preventing cancer associated with expression of FCHLI. FCHLI gene or HYPLIP1 gene and its product are useful for the study of metabolic pathway and cellular mechanism to CC identify other genes, receptors and relationships that contribute to CI lipid disorder and cancer. FCHLI gene or its fragments are useful in gene CC therapy to increase the amount of the expression products of the gene for the treatment of lipid disorder or cancerous cells. The sequence CC variation of FCHLI gene or HYPLIP1 gene is also useful in the diagnosis CC and prognosis of predisposition to lipid disorder and cancer. Antisense CC polynucleotide sequences are useful in preventing or diminishing the CC expression of HYPLIP1 or FCHLI locus. This sequence represents a primer CC used in the analysis of the mouse HYPLIP1 gene.

The invention relates to a human G protein coupled receptor (GPCR), BG8 (ADC98222), and nucleic acids encoding it (ADC98221). The human BG8 gene is located on chromosome 12p12. BG8 is involved in controlling the expression of hard keratins such as the type I hair keratins Ha3 and Ha4 The invention also relates to antibodies against BG8, a drug screening method using the antibodies, the compounds identified, and a method for detecting and controlling functional abnormalities in cells producing hard keratin. The invention provides for the treatment and prevention of diseases associated with the function of hard keratin-producing cells, such as hair loss, hair shaft injury, abnormal or insufficient hair growth, diseases of the skin, tongue, nails and hair, and abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises oligonucleotides for detecting and identifying subtypes of human papilioma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8kin
                                                                                                                                                                                       Protein for treatment and prevention of diseases associated with the function of hard keratin producing cells, such as hair loss, hair shinjury, abnormal or insufficient hair growth, diseases of the skin, tongue, nails and hair.

cc A polynucleotide encoding a polypeptide of the invention may have a use

cc in gene therapy, and as a vaccine. A polypeptide of the invention is

cc useful in the manufacture of a medicament for treating a syndrome

cc associated with a human disease, the disease selected from a pathology

cassociated with the polypeptide. These may also be used in diagnosing,

cc treating or preventing NOVX-associated disorders such as cardiomyopathy,

cc therosclerosis, hypertension, scleroderma, obesity, cancer, diabetes,

cc multiple sclerosis, infections, anorexia, cancer-associated cachexia,

cc multiple sclerosis, infections, anorexia, cancer-associated cachexia,

cc multiple sclerosis, infections, anorexia, cancer-associated cachexia,

cc disease), haematopoietic disorders (e.g. Alzheimer's disease or Parkinson's

cc disease), haematopoietic disorders, dyslipidaemias and other wasting

cc disease), haematopoietic disorders, dyslipidaemias and other wasting

cc used as hybridisation probes, in chromosome mapping, tissue typing,

cc used as hybridisation probes, in chromosome mapping, tissue typing,

cc used as yaccines. The present sequence represents a PCR primer used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, atherosclerosis, asthma or AIDS, and in chromosome mapping, tissue typing pharmacogenomics.

Example SEQ ID NO 240; 562pp; English

The invention relates to a novel (NOVX) human polypeptide. A polypeptide of the invention has cardiant, antiarteriosclerotic, hypotensive, communosuppressive, dermatological, ancrettic, cytostatic, antidiabetic, antimunosuppressive, anti-HIV, antiasthmatic, antibacterial, virucide, anti-HIV, antiasthmatic, antibacterial, virucide, communosuppressive, nootropic, antiparkinsonian, and antilipaemic activity. Comeuroprotective, nootropic, antiparkinsonian, and antilipaemic activity. Compared the conding a polypeptide of the invention may have a use in gene therapy, and as a vaccine. A polypeptide of the invention is cuseful in the manufacture of a medicament for treating a syndrome community of the community of the polypeptide. These may also be used in diagnosing, compassing or preventing NoVX-associated disorders such as cardiomyopathy, cascociated with the polypeptide. These may also be used in diagnosing, community of the polypeptide of the invention of the invention of the polypeptide of the invention of the invention and the cachexia, cascociated with the polypeptide. These may also be used in diagnosing, community of the invention of the associated cachexia, concerned the manufacture of the invention of the useful as vaccines. the invention.

                                                                                                                                                                                                                                                                                                                                         The patent claims a new molecule of formula (NA1---S---NA2)n. NA1 and NA2 are noncomplementary nucleic acid sequences; --S--- = a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA or RNA sequences in a test soln. The scissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolyable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule. In the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        )276/c

NA1 and NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile linkage; n= 1 or 1,000, which is used for the detection of specific DNA or RNA sequences in a test soln. The scissile link probes may be PL (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid Support). The differential liability of DNA and RNA may be exploited in a heterogenous system when the scissile linkage is an RNA molecule. In the examples, counter probe molecules 9 through 16 were used to determine suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         probe MRCO59 is bound by a hydrolysable linkage to a solid support at its 3' end. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or Excil. (Updated on 31-OCT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting target nucleic acid molecules - using excess complementary nucleic acid probes and nicking to complete a cycling sequence.
                                                                                                                                                                          misc_feature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3' end. It is used by reacting excess probe with a target nucleic acid; nicking hybridised probe at least once within a predetermined sequence to form 2 or more probe fragments hybridised to the target sequence, which results in the probe fragments becoming hybridised to another probe; and identifying probe fragments, so detecting the target sequence. The probe can react with target sequence to complete a cycling sequence. Using this system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA and its corresponding protein. Zcytor13 protein is used to promote wound healing in tissues, to exhibit anti-bacterial and anti-viral effects and to identify modulators (e.g. agonists or antagonists). Zcytor13, its agonists or antagonists or disclamation, inflammation, during and after surgery, arthritis, asthma, inflammation, bowel disease or diverticulitis, for modulating spermatogenesis, sperm capacitation, as immunocontraceptive or anti-fertility vaccine and for treating male infertility. Zcytor13 protein and its antibodies are used to diagnose cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13 proteins are used to enhance fertilisation. Zcytor13 antagonists are used to treat myocarditis, atherosclerosis, pelvic inflammatory diseases. Zcytor13 psoriasis, eczema, scleroderma and other inflammatory diseases. Zcytor13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antipsoriatic; cytostatic; antiatherosclerotic; antiinfertility; cardiant; antiinflammatory; dermatological; wound healing; antiviral; antibacterial; therapy; inflammatory bowel disease; diverticulitis; spermatogenesis; sperm capacitation; immunocontraceptive; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          libraries from single cells, designated single-cell cDNA library amplification (SCLA). The method is useful in gene chip technology, differential screening, pathological diagnosis, physiological prognosis and genetic identification. No further information about this sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding it, modulators a

                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a polynucleotide derived from the 4q12-4q13 region of human chromosome 4 and encoding a zsig63 polypeptide, a secreted salivary protein with anti-microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, skin infections, epithelial wounds, chronic tissue damage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for cDNA encoding human zsig63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; zsig63; chromosome 4q12-4q13; salivary protein; antimicrobial; microbial infection; tooth decay; periodontal disease; thrush; emphyses gastrointestinal disease; urinary tract infection; vaginal infection; skin infection; epithelial wound; chronic tissue damage; cystic fibros: acquired immunodeficiency syndrome; AIDS; lung infection; sarcoidosis; chronic bronchitis; gene therapy; protein therapy; primer; ZC7764a.

The present invention relates to a new secreted salivary protein, zsig63. CC The invention is useful for detecting in a test sample, the presence of calso useful as an immunogen for producing an antibody to zsig63 cc also useful as an immunogen for producing an antibody to zsig63 cc polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion protein are useful for enhancing in vivo killing of target tissues. Cc Pharmaceutical composition comprising purified zsig63 polypeptide are useful in the treatment of conditions associated with pathological complexitions associated with pathological complexitions and viral infections. High cc expression of zsig63 in salivary gland suggests that anti-microbial periodontal disease, thrush and gastrointestinal disease. Other capalications can be used in urinary tract infections, vaginal infections, periodontal disease, thrush and gastrointestinal disease. Other capalications can be used in urinary tract infections, vaginal infections, periodontal disease colonisation, and invasion. The invention is useful when pro-inflammatory activity is desired. Applications for such pro-inflammatory activity is desired. Applications for such pro-capacitic particularly in areas having a limited or damaged vascular system e.g., and the properties may be useful as anti-inflammatory agents. The invention is useful for the treatment of patients having incompetent immune system, such as AIDS (acquired immunodeficiency syndrome) patients or individuals that have undergone chemotherapy, radiation treatment. The invention is useful first material for the treatment of lung infections associated with cystic fibrosis and its agonists or antagonists are useful for aiding digestion. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for identification of zsic63

as zsig63 and nucleic acid molecules encoding such polypoptides. Zsig63 can be used in detecting agonists and antagonists of its activity, and is also useful as a host defense polypoptide, immune modulating factor, cc also useful as a host defense polypoptide, immune modulating factor, cc cytokine, or as secreted extracellular matrix associated proteins with cc growth factor hormone activity. It is useful for treating conditions cc associated with pathological microbes, including bacterial, fungal and cviral infections, for treating dental carries (tooth decay), periodontal clients, vaginal infection and for preventing infection in skin and cother epithelial wounds zsig63 is useful for establishing normal context grainst pathogenic colonisation and invasion, for treating chronic tissue damage e.g. damage in extremitles associated with disease, for treating dependence of lung dysfunction, salivary gland dysfunction, or dysfunction of corresponded associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as chromosome 4 associated with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human traits and as considered with disease or other human from the disported and human zsig63 conhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The present invention relates to the isolation of a novel cytokine, CC zalphall Ligand and the polynucleotide encoding it. The invention also CC gives the sequence for the zalphall receptor and the polynucleotide CC encoding it. The zalphall Ligand polypeptide stimulates proliferation of CC entoding it. The zalphall Ligand polypeptide stimulates proliferation of NK CC cells, proliferation of T-cells or NK cell progenitors, the activation of NK CC cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-IgM antibodies. The CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The CC zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand polypucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify CC inhibitors of its activity to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

                                                                                                                                                                                                                                       The invention relates to a method for obtaining a single stranded polynucleotide tag from a biological sample by cleaving one of the complementary strands of a double stranded polynucleotide with a cleavage agent capable of recognising a double stranded polynucleotide comprising complementary strands and cleaving only one of the strands of the polynucleotide in the process of generating a single stranded polynucleotide tag. The method is useful for separating, analysing tags originating partly, and preferably wholly from a source of DNA and/or RNA in a sample comprising biological cells. The method is particularly for analysing gene expression (expression profiling or differential gene expression), or in diagnosing clinical conditions. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Obtaining single stranded polynucleotide tags from a biological sample, for analyzing gene expression or diagnosing clinical conditions, comprises employing nicking endonucleases that cleave complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24-JAN-2001; 2001DK-00000126.

The invention is based on the discovery that ODNs containing deoxynutidine residues (U-ODNs) have an immunostimulatory effect comparable to, or in many instances greater than, ODNs containing to motifs, producing higher numbers of specific T cells to given antigen. The U-ODNs do not induce the systemic production of pro-inflammatory cytokines and, in contrast to CPG ODNs, are not dependent on a specific motif or a palindromic sequence. Use of a U-ODN for the preparation of a vaccine is claimed. Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response against a melanoma-derived peptide (see

Novel isolated zsig63 polypeptide, member of the adhesin family, useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, infections.

1; Page 29; 32pp; English

cc vector, a cultured cell comprising the vector and expressing the protein, cc a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-126, 127-219 or 16-219 of zsig63 and an additional protein), using a CC zsig63 reporter gene construct to identify zsig63 agonists, and producing cc an anti-zsig63 antibody using zsig63 immunogenic peptides, Zsig63 is CC useful for detecting in a test sample, the presence of antagonist of zsig63 protein activity. Zsig63 has antimicrobial activity and since cexhibits high expression in salivary gland, can be used for treating CC dental carries, periodontal disease, thrush, and gastrointestinal CC dental carries, periodontal disease, hurush, and gastrointestinal CC disease, urinary tract infections, vaginal infections, skin infections can deter epithelial wounds. The polypeptides can be used for treating CC invasion. Zsig63 can also be used for providing pro-inflammatory activity correct invasion. Zsig63 can also be used for providing pro-inflammatory activity correct invasion. Zsig63 can also be used for providing pro-inflammatory activity correct invasion. Zsig63 patients or in individuals that have undergone consumterapy, radiation treatment, for treating lump infections e.g. in cystic fibrosis. Detection of zsig63 polypeptide at relatively high conditions associated with salivary gland or lung dysfunction including conditions associated with salivary gland or lung dysfunction including conditions associated with salivary gland or lung dysfunction including conditions and may be used to replace serum that is commonly used in culture. The DNA is unseful in gene therapy applications to increase or inhibit zsig63 activity, and for detecting abnormalities on human conditions and dentin dysplasia type III. Zsig63 is an addesin family member. The correct in the conditions and for detecting is an and serious conditions. The invention relates to an isolated zsig63 polypeptide comprising at least 90% identity to an amino acid sequence which comprises domain 1 zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also included are the polynucleotide encoding zsig63, a zsig63 expression present sequence is a primer used encoding human zsig63 to isolate and sequence nucleic acdis Of.

Improved polymerase thermocycling reaction for nucleic acid amplification, by thermal cycling of promoter-linked nucleic acid template synthesis and in vitro transcriptional amplification of nucleic acid sequences.

Example 4; Page 14; 28pp; English

CC (MI) for linear amplification of nucleic acid sequences, involves and denatured (I) with a promoter acid templates (I), combining the CC denatured (I) with a promoter acid templates (I), a primer (P2), a CC number of deoxymucleotide triphosphates and ribonucleotide triphosphates, CC number of deoxymucleotide triphosphates are reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA CC polymerase, contacting P1 with (I) to generate a number of promoter-containing templates, contacting P2 with the denatured promoter-containing templates to CC generate a number of promoter-containing templates to CC generate a number of promoter-containing double-stranded DNA templates are flanked by P1 in one CC end and P2 in the other end of the other orientation, transcribing the promoter-containing double-stranded DNA templates to form a number of CC promoter-containing double-stranded DNA templates to form a number of containing double-stranded DNA templates to form a number of containing double-stranded DNA templates to form a number of promoter-containing double-stranded DNA templates, contacting the amplified RNA containing double-stranded DNA templates, to form a number of containing the amplified RNA complified RNA templates, contacting the amplified RNA complified RNA templates, contacting the machine of in uncleic acid sequences, and thus for producing mRNA complified RNA is also useful for determining aberrant protein production of cells in a diseased state, by generating an expression profile by the capression profile of the cells in the normal and diseased states, comparing the contacting the mRNA composition of the cell(s) in the diseased state, by the diseased state, amplifying the mRNA sequences of cell(s) in the diseased cate that differ from mRNA in cell(s) in non-diseased state, amplifying the solated state, amplifying the solated state, amplifying aberrant protein function of the cell state and diseased states. The invention relates to an improved polymerase thermocycling reaction amplifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell in a diseased state caused by aberrant protein production, by

determining protein expression of a cell in a diseased state, determining

the mRNA sequence for the aberrant proteins, synthesising an antisense

sequence of the mRNA, amplifying the antisense mRNA sequences by MI, and

comprising the anti-sense mRNA and a compatible lipid based biological

comprising the anti-sense mRNA and a compatible lipid based biological

comprising the aberrant protein, by determining aberrant protein

production of cell in a diseased state by the above method, amplifying

the aberrant protein by MI and using recombinant techniques to determine

the effect of proposed drug on the aberrant protein. MI is also useful

for differential screening of tissue-specific gene expression at a

cellular level, for preparing labeled RNA/DNA probes for a gene chip

technology, and for determining the efficacy of a drug regiment against a

gene or its cDNAs. The present sequence is an Oligo (dT) primer used to

produce second strand cDNA in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                              13-MAY-1997;
19-MAY-1997;
27-MAR-1998;
The invention relates to preparation of a normalised, subdivided library of amplified cDNA from the coding regions of mRNA in a sample. The method involves reverse transcription, with at least one cDNA primer of formula 5'-Con1-dTn2-Vn3-Nn4 to form first stand cDNA where Con1 = any sequence of 1-100 nucleotides; dT = deoxythymidiny1; n2 is at least 1; n3 and n4 are both 0, or n3 is 1 and n4 is at least 1; followed by second strand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Normalised; cDNA library; mRNA cloning; reverse transcription; immobilise; screening; hybridisation; nucleic acid amplification; expression pattern; drug development; PCR primer; RT-PCR; ss.

Comparison of cDNA in the prepared library with a database (a computer-generated list of molecular weights of restricted DNA fragments of known sequence) is used to determine presence of an expressed protein in a cell, also to detect changes in such expression (particularly for diagnosis of disease). Surfaces (chip) having amplified cDNA stably immobilised on it, obtained by a similar method, are used to screen for genes of a particular family, by hybridisation with nucleic acid from the family (to identify new genes) and to detect differences in expression patterns between cells. The polypeptides expressed by the libraries can be used for drug development. Sequences AAV/1935 to
                                                                                                                                                                                                                                                                             Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic

```

This invention describes a novel method (M1) for inserting a nucleic acid (N1) into a circular vector (V1) comprising joining ends of N1 and V1 under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reamnealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex oppulations of DNA or cDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA40351-A40366 represents primers used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         βX
catalytically inactive, but which becomes catalytically active in the presence of an analyte (the effector); providing a nucleic acid substrate for the catalytic activity of the nucleic acid sequence; and contacting the nucleic acid sequence and the substrate with the sample under conditions allowing catalytic activity of nucleic acid sequences. The catalytic nucleic acid sequence will be able to convert the nucleic acid substrate into a nucleic acid product only if the analyte of interest is present. The nucleic acid product only if the analyte of interest is gresent. The nucleic acid catalytic product is then amplified, and a significant increase in the amount of product indicates the presence of the analyte determination of an analyte in a sample in diagnostic quantitative determination of an analyte in a sample in diagnostic assays. The invention describes the in vitro selection of a ribozyme corresponce of an oligonucleotide effector (AAAS7854). The Li ribozyme ligase was selected from a pool of RNA molecules comprising a central catalogues and a central catalogues and contral catalogues in length flanked on both sides by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc constant sequence regions (the N90 RNA pool; AAA57851). In the presence of the effector, selection was performed using one of the tagged substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e., those which have become ligated to the substrate molecule) were reverse transcribed using the effector oligo, and then PCR amplified using the ceffector and a DNA primer identical in sequence to the substrate used for the selection. A ribozyme ligase, L1, was selected via this procedure. L1 can only adopt its active conformation (AAA57859) in the presence of the effector oligo (analyte). In the absence of the effector, L1 adopts an inactive conformation (AAA57860). The present sequence represents the deoxy-T22-tagged substrate oligonucleotide. The dT22 tag enables successfully ligated products to be isolated using oligo(dA) cellulose Type 7. Note: The present sequence is not given in the specification, but is created from the inforamtion given on page 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                           an
```

0;

The present invention relates to a method for affixing to an RNA molecule through the formation of a covalent

a peptide acceptor bond, noncovalent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bond, or by chemical ligation. The method is useful for producing RNA-protein fusions which can be used for the isolation of proteins or nucleic aids with desired properties from large pools of partially or completely random amino acid or nucleic acid sequences. The present sequence is an RNA oligonucleotide used in the present invention
  The present invention relates to the identification of specific proteolytically cleavable peptides by incubating a library of fusion molecules, comprising a peptide and nucleic acid encoding said peptide, with a proteolytically active sample, then isolating the cleavage tragments and determining the coding sequences in the separated fusion molecules. The coding sequences identified by the method are used for production of specifically proteolytically cleavable substances, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               stroke; neuronal disease; arthritis; pancreatitis; hypertension; thrombosis; infection; schistosomiasis; herbicide; insecticide; fungicide; cerebroprotective; neurological; antiarthritic; pancreatic; hypotensive; antithrombotic; virucide; protozoacide; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ន្តន្តន្តន្តន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                          cc activity of cells comprising detecting, in a sample, the concentration cand/or subcellular localization of APC (denomatous polyposis coli) cc protein (I). The invention also describes (1) determining function of (I) cc in a sample by detecting presence of the C-terminal, DNA-binding domain of (I); (2) detecting presence of the C-terminal, DNA-binding domain of (I); (3) purifying, enriching and/or detecting ct the DNA-binding domain of (I); (3) purifying, enriching and/or detecting cc (I) or its fragments by reaction with a probe; (4) double-stranded DNA (CC (S2); (5) peptide fragment of (I) containing at least the DNA-binding cc domain; (6) antibodies (Ab) directed against an epitope of positions 1340 cc (1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies, (CC (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or its fragments in a sample consisting of (II), Ab or the set of (7). The method is used to detect proliferative, especially tumor (precursor), cells, to detect proliferative, especially tumor (precursor), and purify and to purify capacity of (I), and to purify capacity of (I) and to purify capacity of (II) and to purify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                            The invention relates to a novel polynucleotide comprising a sequence encoding a ribozyme that can aminoacylate tRNA with a non-cognate amino acid. Ribozymes encoded by the polynucleotide of the invention are used to prepare polypeptides that contain non-cognate, including non-natural, amino acids. The invention more specifically provides catalytic RNA molecules having cis aminoacylation activity with a catalytic and aminoacylation domain, or an RNA molecule with trans aminoacylation activity with only a catalytic domain. The products of the invention are potentially useful for biomedical and therapeutic use, e.g. for probing the structure and function of proteins; preparation of peptide libraries and in proteomics. This polynucleotide sequence represents a DNA oligo relating to the RNA molecule with aminoacylation activity of the

The method involves culturing a prokaryote that has been transformed with a vector encoding a signal peptide and a cytochrome C maturation protein. The method of the invention is useful for producing cytochrome C. Cytochrome C produced by the method of the invention is used in reagent; and drugs for trapping nitrogen oxide (e.g. in purifying polluted atmosphere by trapping nitrogen oxide). The present DNA sequence represents a Porphyra yezoensis cytochrome C - related PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Production of cytochrome c by culturing prokaryote transformed with vector containing e.g. DNA of signal peptide and of eukaryotic cytochrome c maturation protein for use in reagents and drugs for trapping nitrogen

The haplotyping methods are useful in validating APPBP1 as a candidate target for treating a specific condition or disease predicted to be associated with APPBP1 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with APPBP1 activity. The transgenic animals are useful for studying expression of the APPBP1 isogenes in vivo, for in vivo screening and testing of drugs targeted against APPBP1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet aggregation in a biological system. ABK32771-ABK32337 represent human APPBP1 gene allele-specific oligonucleotides used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Amyloid beta precursor protein binding protein 159 kD (APPBP1) gene polymorphic variants, useful e.g. in studying the expression and function of APPBP1 and screening candidate drugs for treating Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which is a polymorphic variant of a reference sequence for the amyloid beta precursor protein binding protein 1, 59kD (APBBP1) protein or its fragment. The polymorphic variants are useful in studying the expression and function of APBBP1, in expressing APBBP1 protein for use in screening for candidate drugs to treat diseases related to APBBP1 activity, in
                                                                                                                                                            Glucosinolate; UDP-glucose:thiohydroximate S-glucosyltransferase; S-GT; transgenic plant; rapeseed oil; oilseed rape; canola; Brassica napus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Degenerate primers based on 7 peptide sequences (AAW09826-32) of Brassica oleracea UDP-glucose:thiohydroximate S-glucosyltransferase (S-GT) were used in the PCR-RACE amplification of Brassica napus S-GT cDNA (see also AAT66166). Primer gI3 (AAT66167) was combined with the Anchor Primer of the Clontech 3'RACE kit (AAT66170), and the product was used as template in a second semi-nested PCR to yield S-GT partial clone pGL2-7 (AAT66173)

The invention relates to the molecular differentiation of Leishmaniasis parasites. The method of the invention comprises detection of parasites of the Leishmania (Viannia) braziliensis, Leishmania (Viannia) guyanensi and Leishmania mazonensis species. The method employs initiators

buffer solution in a polymerase

                                                                             The sequences represented by, AAQ90390-90401 are synthetic DNA probes containing 3' ribonucleoside termini. The sequences shown in AAQ90402-15 are synthetic DNA probes with 5' amino termini. These sequences were specific for the polymorphisms of HIA gene dQa. The sequences were used in the device of the invention. This is a self-addressable electronic device (SAED) that can be used to carry out multi-step and multiplex reactions, such as nucleic acid hybridisations. The advantages of this method are that these reactions can be carried out with complete and precise electronic control, and that the rate, specificity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CP-1;

                                                                                                                    are used in the construction of the electronically self-addressable device (ED) of the invention. The ED comprises a substrate, an electro or opt. a number of electrodes supported by the substrate, a current source operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecul The ED is used for genetic typing and comprises a number of electronically addressable locations each comprising an electrode, and binding entity, such as one of these probes, attached to each of the locations capable of detecting the presence of a genetic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4020 AAAAAAGAGAGAAAACAAAAT 4040

A key aspect of this inventions is played by the ion permeable permeation layer which overlies the electrode. This permeation layer allows attachment of nucleic acids to permit immobilization but also separates the attached oligonucleotides and hybridized target DNA sequences from the highly reactive electrochemical environment generated immediately at the electrode surface. The microelectronic device is designed and fabricated to actively carry out and control reactions such as nucleic acid hybridizations, antibody/antigen reactions, sample preparation, diagnostics and biopolymer synthesis. The device can electronically control the transport and attachment of specific binding entities, such as nucleic acids and polypeptides, to specific binding entities, such as nucleic acids and polypeptides, to specific micro-locations. The device can subsequently control the transport and reaction of analytes or reactants at the addressed specific micro-locations. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Microelectronic device; multi-step reaction; microscopic format; ion-permeable permeation layer; electrode; electrical control; transport; attachment; binding; DNA/RNA hybrid; probe; ss.

The method can be used to analyse gene expression rapidly and easily

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is action a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gen present in cells of the precancerous condition, where the normal somaticells of the patient are heterozygous for the first gene, the inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; call especific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                            Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can k used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometricels, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                    The oligonucleotide sequence is used as a probe to selectively detect Agrobacterium rhizogenes-derived plasmid DNA, as inserted into a plant genome. It is chemically synthesised and is complementary to T-DNA codifor the Ri plasmid of A.rhizogenes. It can also be used as a PCR primes and can easily detect a particular extraneous gene from a transformant plant with high sensitivity and selectivity
                                                                                                                                                                                                                                   Oligo:nucleotide for detection of transformant of plant chain reaction process to enable detection of specific with high sensitivity and selectivity.
                                                                                              Sequence
                                                                                                                                                                                                            Claim 1; Page 1;

(SF-PLA2 is more closely related to group II PLF enzymes such as those in rattlesnake venom than to pancreatic PLA2). To oligonucleotide (especially its phosphorothicate analogue) would be useful in inhibiting SF-PLA2 expression. SF-PLA2 secretion has been detected from a human epidermal carcinoma cell line and primary human epidermal keratinocytes. This suggests that the inhibitory oligonucleotide would be useful in the treatment of inflammatory disorders of the skin. See AAQ14859-Q14895
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligo-nucleotide analogues which modulate arachidonic acid metabolism for treatment and diagnosis of conditions caused by lipoxygenase, phospholipase, leukotriene(s) etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             phosphorothioate linkage; SF-PLA2; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      osteoarthritis; lupus; anaphylaxis; urticaria; asthma; psoriasis, hepatitis; cerebral oedema; contact dermatitis; ulcerative coliti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The detection probe CT3 (AAQ70288) is complementary to a region of the 16S rRNA sequence of Chlamydia trachomatis which forms part of a hairpin loop. The probe is only able to hybridise to the target RNA in the presence of a capture probe (i.e. dCT4, AAQ70289) immobilised on a support. The capture probe destabilises the secondary structure of the hairpin loop. The oligonucleotide probes CT3 and dCT4 are useful for distinguishing Chlamydia trachomatis from other closely related Chlamydia species. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Solid-phase capture probes for nucleic acid hybridisation assays -comprising immobilised oligo:nucleotide capable of destabilisation secondary structure formed in target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Capture probe;

New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.

Disclosure; Page 26; 144pp; English.

The sequences given in AAQ61917-55 are oligonucleotides which contain a G4 stretch and which may be used for inhibiting phospholipase A2 enzyme activity. Oligonucleotides such as these may also be used for inhibiting activity of HSV, HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A series of 21 phosphorothioate antisense oligonucleotides (ONs) (AATI1987- 2007) were examined for anti-cytomegalovirus (CMV) activity. ISIS 4847 targets the DNA polymerase gene 5' untranslated region. It has an IC50 value of 0.9 microM. (ONs which inhibit CMV at one-third the dosage (or below) at which the negative control shows activity in this experimernt (IC50 = 1 microM. or less) are preferred). Antisense ONs targeting CMV DNA or RNA coding for the IE1, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONs may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothioate backbones, alkyl and halogen-substituted sugar moieties at the 2' position. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligomers are claimed which (A) have at least one peptide nucleic CC acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5' CC untranslated region, intron/exon junction or coding sequence of CC cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or CC hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a CC papillomavirus. The PNAs can be used to target RNA and single stranded CC DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and CC papillomavirus processes and also as diagnostics (e.g., as probes for CC specific mRNAs). PNA oligomers have high affinity for complementary CC single stranded DNA. They are also able to form triple helices in which a first pNA strand binds with RNA or ssDNA and a second pNA strand binds CC with the resulting double helix or with the first pNA strand. The PNAs CC possess no significant charge and are water soluble, which facilitates CC cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by croteases. The present sequence targets CMV DNA polymerase 5' CC untranslated region (5' UTR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC human cDNA sequence encoding SH-PTP1 (protein tyrosine phosphatase-1, CC with two SH2 domains). The primers are used in the analysis of the SH-CC PTP1 gene of patients with acute lymphoblastic leukaemia (ALL). A CC fragment complemetary to the SHPTP-1 sequence from nucleotides 537-653 is CC domains of the two tandems of the SHPTP-1 sequence from nucleotides 537-653 is CC domains for the two tandems SH2 domains (see AAR99312). If the probe cc region coding for the two tandems SH2 domains (see AAR99312). If the probe CC differentive of an abnormality, normally associated with neoplastic disease, in partic, ALL. The probe hybridises to a part of the CC differentive of an abnormality, normally associated with neoplasia.

CC Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or protein may be comparison to sequenced PTP genes taken from a patient, where CC differences indicate an abnormality. The activity of SH-PTP1 may also be composely altered by mutation to effect a change in megakaryocyte content of the first production and hence platelet production. (Updated on 25-MAR-2003 to

Determining whether a human patient has a tumour or a metastasised tumour, comprises determining whether a cytokeratin 20 (CK20) gene prod. is present in a tissue sample that does not normally contain CK20. This method is partic. useful for the detection of epithelial cell tumours, e.g. colorectal, stomach, mucinous ovarian or gall bladder adenocarcinoma or bladder or transitional cell carcinoma. In an example RNA was extracted from normal human blood samples and samples spiked with adenocarcinoma HT29 cells, transitional cell carcinoma RT112 cells or breast adenocarcinoma MCF-7 cells and subjected to PCR amplification using the CK20, CK8 or CK19 mRNA specific primers AAT31769/70, CNB and CK19 mRNA was not detected in normal blood, but a respective 370, 244 or 214 bp prod.
                                                                                                                                                                                                                                                                                                                                                                                  Detection of gene prod.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tresidues (such as these sequences) are triplex forming oligonucleotides, and form purine rich promoter elements used to inhibit transcription. These sequences bind to the HIV 99120 protein at the V3 loop via the internal guanosine quartet. This binding prevents cell-to-cell and virus-to-cell infection. The sequences may also be used for inhibiting viral growth, and other viral genes, for inhibiting the enzyme PLA2, and to modulate telomere length. In some cases these sequences need to be chemically modified. The chemically modified oligonucleotides preferably include at least one phosphorothioate linkage. Other modified intersugar links, or 2'-modified sugar residues can also be used. These oligonucleotides can be used for coating gloves, condoms, etc., or for topical application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                               This sequence represents an initialising oligonucleotide for a fragment of gUC19. The invention relates to a method for the identification of a sequence of nucleotides in a polynucleotide (PNT), which involves: (a) extending an initialising oligonucleotide (ONT) along the PNT by ligating an ONT probe to form a duplex; (b) identifying one or more nucleotides of the PNT; and (c) repeating steps (a) and (b) until the nucleotide sequence is determined. The method is useful e.g. in gene function and control investigations, genomic analysis, genetic identification, forensic analysis, genetic counselling or medical diagnostics. The method avoids the need for electrophoratic separation of similarly sized DNA fragments, eliminates the difficulties associated with detection and analysis of spatially overlapping bands of DNA fragments in a gel or similar medium and avoids the need to generate DNA fragments from long
                                                                                                                                                                                                                                                                                                                                  Sequencing DNA by parallel oligo:nucleotide extension - extending initialising oligonucleotide by ligating probe avoiding electrophoretic sepns.
                                                                                                                                                                                                                                                                                                                                                                                      WPI;
                                                                                                                     single-stranded

                                                                                                                                                                                                                                           This sequence represents an initialising oligonuclectide for a fragment of pUC19. The invention relates to a method for the identification of a sequence of nucleotides in a polynucleotide (PNT), which involves: (a) sequence of nucleotides in a polynucleotide (PNT), which involves: (a) extending an initialising oligonucleotide (ONT) along the PNT by ligating an ONT probe to form a duplex; (b) identifying one or more nucleotides of the PNT; and (c) repeating steps (a) and (b) until the nucleotide sequence is determined. The method is useful e.g. in gene function and control investigations, genomic analysis, genetic identification, forensic analysis, genetic counselling or medical diagnostics. The method avoids the need for electrophoretic separation of similarly sized DNA fragments, eliminates the difficulties associated with detection and analysis of spatially overlapping bands of DNA fragments in a gel or similar medium and avoids the need to generate DNA fragments from long
                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequencing DNA by parallel oligo:nucleotide extension - involving extending initialising oligonucleotide by ligating probe to form duplex,

The method comprises adding at least one dimeric phosphoramidite synthon, optionally having a protected thiosester group in its internucleotide link, during the synthesis cycle. These novel dimeric phosphoramidite synthons are used as antisense molecules for inhibition of gene expression. The method gives increased yields of the phosphorothiate oligonucleotide (since fewer cycles are needed) and facilitates separation of impurities (greater difference in

Recombinant FGF-10, vectors, containing the DNA, and host cells, containing the vectors, are useful for the recombinant production of FGF-10. The recombinant FGF-10 is useful for the treatment of diseases and injury of bone or cartilage,

                                                                                                                                                                                                                                                      describes human telomerase reverse transcriptase (hTRT). The present clinvention also describes the following methods: (A) determining whether a cream compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (C) preparation of hTRT with a telomerase by contacting a protein of the complex formed and detection, and detecting the product and correlating the presence of RNA detection, and the product and correlating the presence of complex or amplification, and (B) the use of an agent that causes an increasing hTRT expression, and (B) the use of an agent that causes an increase in cell correspicate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicament that inhibits to treat conditions that are associated with high telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a PCR primer for DNA encoding the human retina specific ATP binding cassette transporter (ABCR) of the invention. ABCR may be used in compositions for screening agents that alters ABCR. The agent can inhibit Stargardt Disease, Fundus Flavimaculatus and ageralated macular degeneration (MD). Primers (such as this sequence) and probes for the ABCR DNA can be used in a diagnostic kit for detecting M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Retina-specific ATP-binding cassette transporter and DNA -e.g. diagnosis and treatment of macular degeneration, such Stargardt Disease, Fundus Flavimaculatus and age-related de

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                         An oligomer has been developed which is capable of inhibiting expression CC of an interleukin gene. The interleukin gene is preferably an interleukin CC -15 (IL-15) gene. The oligomer can be an oligonucleotide or an CC oligonucleotide analogue. When it is an oligonucleotide analogue it is gelected from protein nucleic acid, morpholino, methylene linkage, CC boronated, and pteridine oligonucleotide analogues. The analogue is CC linked at its 5' end or 3' end to an intercalator. The intercalator is a CC psoralen or acridine derivative. The oligomer is preferably an CC oligonucleotide made of DNA. The oligomer is preferably an CC oligonucleotide derivative, especially a phosphodiester oligonucleotide. The oligonucleotide is at least 5 (preferably 5-50) nucleotides, in CC length. The present sequence represents a specifically claimed CC oligonucleotide of the present invention. The oligoner can be used to alleviate inflammatory polyarthopathy, especially that associated with C rheumatolid arthritis. The oligomer can also be used to alleviate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a PCR primer for DNA encoding the human retina specific ATP binding cassette transporter (ABCR) of the invention. ABCR may be used in compositions for screening agents that alters ABCR. The agent can inhibit Stargardt Disease, Fundus Flavinaculatus and ageralated macular degeneration (MD). Primers (such as this sequence) and probes for the ABCR DNA can be used in a diagnostic kit for detecting MD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligomer capable of inhibiting expression of an interleukin gene - is used to alleviate inflammatory poly-arthopathy, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Interleukin gene; IL-15; inhibitor; oligomer; expression; transcription-inhibiting complex; polypurine-polypyrimidine inflammatory poly-arthopathy; rheumatoid arthritis; asthma;
